

Estimating the Effect of a Mis-measured, Endogenous, Binary Treatment

Francis J. DiTraglia
Camilo Garcia-Jimeno

University of Pennsylvania

December 6th, 2016

What is the causal effect of T^* ?

$$y_i = h(T_i^*, \mathbf{x}_i) + \varepsilon_i$$

- ▶ y – Outcome of interest
- ▶ h – Unknown function that *does not depend on i*
- ▶ T^* – Unobserved, endogenous binary treatment
- ▶ T – Observed, mis-measured binary surrogate for T^*
- ▶ \mathbf{x} – Exogenous covariates
- ▶ ε – Mean-zero error term
- ▶ z – Discrete (typically binary) instrumental variable

Target of Inference:

ATE function: $\tau(\mathbf{x}) = h(1, \mathbf{x}) - h(0, \mathbf{x})$

Example: Smoking and Birthweight (SNAP Trial)

Coleman et al. (N Engl J Med, 2012)

RCT with 1050 pregnant smokers in England: 521 given nicotine patches, the rest given placebo patches.

- ▶ y – Birthweight
- ▶ T^* – True smoking behavior
- ▶ T – Self-reported smoking behavior
- ▶ \mathbf{x} – Mother characteristics
- ▶ z – Indicator of nicotine patch

Example: Schooling and Test Scores

Burde & Linden (2013, AEJ Applied)

RCT in Afghanistan: 32 villages divided into 11 clusters. Randomly choose 6 and set up school in each village of these clusters.

- ▶ y – Child's score on math and language test
- ▶ T^* – Child's true school attendance
- ▶ T – Parent's report of child's school attendance
- ▶ \mathbf{x} – Child and household characteristics
- ▶ z – School built in village

Example: Returns to Schooling

Oreopoulos (2006, AER)

Fuzzy RD: minimum school-leaving age in UK increased from 14 to 15 in 1947 but some already stayed until 15 before the law and others failed to comply after it.

- ▶ y – Log wage
- ▶ T^* – School attendance at age 15
- ▶ T – Self-report of school attendance at age 15
- ▶ x – Individual characteristics
- ▶ z – Indicator: born in or after 1933

Binary, Endogenous Treatment

Mahajan (2006), Shiu (2015), Ura (2015)

► Mahajan Details

Model: $y = c + \beta T^* + \varepsilon$

Valid Instrument

$$\mathbb{E}[\varepsilon|z] = 0.$$

First-stage

$$p_k^* \equiv \mathbb{P}(T^* = 1|z = z_k) \neq \mathbb{P}(T^* = 1|z = z_\ell) \equiv p_\ell^*, \quad k \neq \ell$$

Non-differential Measurement Error

- ▶ $\mathbb{E}[\varepsilon|T^*, T, z] = \mathbb{E}[\varepsilon|T^*, z]$
- ▶ $\alpha_0 = \mathbb{P}(T = 1|T^* = 0, z)$
- ▶ $\alpha_1 = \mathbb{P}(T = 0|T^* = 1, z)$
- ▶ $\alpha_0 + \alpha_1 < 1$

Observable Moments: $y = c + \beta T^* + \varepsilon$

| | $z = 1$ | $z = 2$ | \dots | $z = K$ |
|---------|----------------------------|----------------------------|---------|----------------------------|
| $T = 0$ | \bar{y}_{01} p_{01} | \bar{y}_{02} p_{02} | \dots | \bar{y}_{0K} p_{0K} |
| $T = 1$ | \bar{y}_{11} p_{11} | \bar{y}_{12} p_{12} | \dots | \bar{y}_{1K} p_{1K} |

$$\bar{y}_{tk} = \mathbb{E}[y | T = t, z = z_k], \quad p_{tk} = q_k p_k$$

$$q_k = \mathbb{P}(z = z_k), \quad p_k = \mathbb{P}(T = 1 | z = z_k)$$

Unobservable Moments: $y = \beta T^* + u$

Define error term that absorbs constant: $u = c + \varepsilon$

| | $z = 1$ | $z = 2$ | \dots | $z = K$ |
|-----------|--------------------------|--------------------------|---------|--------------------------|
| $T^* = 0$ | m_{01}^* p_{01}^* | m_{02}^* p_{02}^* | \dots | m_{0K}^* p_{0K}^* |
| $T^* = 1$ | m_{11}^* p_{11}^* | m_{12}^* p_{12}^* | \dots | m_{1K}^* p_{1K}^* |

$$m_{tk}^* = \mathbb{E}[u | T^* = t, z = z_k], \quad p_{tk}^* = q_k p_k^*$$

$$q_k = \mathbb{P}(z = z_k), \quad p_k^* = \mathbb{P}(T^* = 1 | z = z_k)$$

Possible Restrictions On m_{tk}^*

Joint Exogeneity: $\mathbb{E}[\varepsilon | T^*, z] = 0$

$$\implies m_{tk}^* = c \quad \text{for all } t, k$$

Exogenous Treatment: $\mathbb{E}[\varepsilon | T^*] = 0$

$$\implies \frac{1}{\mathbb{P}(T^* = t)} \sum_k p_{tk}^* m_{tk}^* = c \quad \text{for all } t$$

Exogenous Instrument: $\mathbb{E}[\varepsilon | z] = 0$

$$\implies (1 - p_k^*) m_{0k}^* + p_k^* m_{1k}^* = c \quad \text{for all } k$$

System of Equations given $E[\varepsilon|z] = 0$

$\mathbb{E}[\varepsilon|z] = 0 \implies$ *pair of equations for each $k = 1, \dots, K$*

$$\hat{y}_{0k} = \alpha_1(p_k - \alpha_0) \left(\frac{\beta}{1 - \alpha_0 - \alpha_1} \right) + (1 - \alpha_0)c - (p_k - \alpha_0)m_{1k}^*$$

$$\hat{y}_{1k} = (1 - \alpha_1)(p_k - \alpha_0) \left(\frac{\beta}{1 - \alpha_0 - \alpha_1} \right) + \alpha_0 c + (p_k - \alpha_0)m_{1k}^*$$

where $\hat{y}_{0k} = (1 - p_k)\bar{y}_{0k}$ and $\hat{y}_{1k} = p_k\bar{y}_{1k}$

2K Equations in $K + 4$ Unknowns

β is unidentified regardless of K .

Proof of special case: $\alpha_0 = 0$

1. System of equations:

$$\tilde{y}_{0k} = c + p_k \left(\frac{\beta \alpha_1}{1 - \alpha_1} \right) - p_k m_{1k}^*$$

$$\tilde{y}_{1k} = p_k \beta + p_k m_{1k}^*$$

2. $\beta/(1 - \alpha_1) \equiv \beta_{IV}$ identified, $\beta \alpha_1/(1 - \alpha_1) = \beta_{IV} - \beta \implies$

$$(c + p_k \beta_{IV} - \tilde{y}_{0k})/p_k = \beta + m_{1k}^*$$

$$\tilde{y}_{1k}/p_k = \beta + m_{1k}^*$$

3. Sum equations from 1. $\implies (c + p_k \beta_{IV} - \tilde{y}_{0k}) = \tilde{y}_{1k}$

Bounds for Mis-classification Probabilities

$$\alpha_0(z) = \alpha_0, \alpha_1(z) = \alpha_1$$

$$\implies p_k^* = \frac{p_k - \alpha_0}{1 - \alpha_0 - \alpha_1}, \quad 1 - p_k^* = \frac{1 - p_k - \alpha_1}{1 - \alpha_0 - \alpha_1}$$

$$\alpha_0 + \alpha_1 < 1 \iff \text{Cor}(T, T^*) > 0 \iff (1 - \alpha_0 - \alpha_1) > 0$$

$$\alpha_0 < \min_k \{p_k\}, \alpha_1 < \min_k \{1 - p_k\}$$

$$\alpha_0 \leq \min_k \{p_k\}, \quad \alpha_1 \leq \min_k \{1 - p_k\}$$

Bounds for β

$$\mathbb{E}[\varepsilon|z] = 0$$

$$\implies \beta_{RF} = \mathbb{E}[y|z_k] - \mathbb{E}[y|z_\ell] = \beta(p_k^* - p_\ell^*)$$

Mis-classification

$$\implies p_k^* - p_\ell^* = (p_k - p_\ell)/(1 - \alpha_0 - \alpha_1)$$

$$\text{Combining: } \beta_{IV} = \beta/(1 - \alpha_0 - \alpha_1)$$

$$\alpha_0 + \alpha_1 < 1 \implies$$

- ▶ β is between β_{RF} and β_{IV}
- ▶ β_{IV} *inflated* but has correct sign
- ▶ β_{RF} bound equivalent to substituting α_0, α_1 bounds

Strengthening the Measurement Error Assumptions

- ▶ $\alpha_0 = \mathbb{P}(T = 1 | T^* = 0, z)$
- ▶ $\alpha_1 = \mathbb{P}(T = 0 | T^* = 1, z)$
- ▶ $\alpha_0 + \alpha_1 < 1$
- ▶ $\mathbb{E}[\varepsilon | T^*, T, z] = \mathbb{E}[\varepsilon | T^*, z]$

Additional Assumption

$$\mathbb{E}[\varepsilon^2 | T^*, T, z] = \mathbb{E}[\varepsilon^2 | T^*, z]$$

Improve bounds for α_0, α_1 to tighten lower bound for $\beta \dots$

Tighter Bounds for α_0, α_1 from Conditional Variances

Assume

$$\mathbb{E}[\varepsilon^2 | T^*, T, z] = \mathbb{E}[\varepsilon^2 | T^*, z]$$

Observables

$$\sigma_{tk}^2 = \text{Var}(y | T = t, z = k)$$

Constrain Unobservables

$$s_{tk}^{*2} = \text{Var}(u | T^* = t, z_k) > 0$$

$$\begin{aligned} (p_k - \alpha_0) \left[(1 - \alpha_0)p_k\sigma_{1k}^2 - \alpha_0(1 - p_k)\sigma_{0k}^2 \right] &> \alpha_0(1 - \alpha_0)p_k(1 - p_k)(\bar{y}_{1k} - \bar{y}_{0k})^2 \\ (1 - p_k - \alpha_1) \left[(1 - \alpha_1)(1 - p_k)\sigma_{0k}^2 - \alpha_1p_k\sigma_{1k}^2 \right] &> \alpha_1(1 - \alpha_1)p_k(1 - p_k)(\bar{y}_{1k} - \bar{y}_{0k})^2 \end{aligned}$$

Schooling and Test Scores – Afghan RCT

Burde & Linden (2013, AEJ Applied)

“Weak” Bounds

$$\beta \in [0.65 \times \beta_{IV}, \beta_{IV}]$$

Add 2nd Moments

$$\beta \in [0.78 \times \beta_{IV}, \beta_{IV}]$$

Independence Assumption: $\varepsilon \perp T | (T^*, z)$

Define $F_{tk}(\tau) = \mathbb{P}(Y \leq \tau | T = t, z_k)$ and $F_k(\tau) = \mathbb{P}(Y \leq \tau | z_k)$

$$\alpha_0 \leq p_k \inf_{\tau} \left\{ \left[\frac{F_{1k}(\tau)}{F_k(\tau)} \right] \wedge \left[\frac{1 - F_{1k}(\tau)}{1 - F_k(\tau)} \right] \right\} \leq p_k$$

$$\alpha_1 \leq (1 - p_k) \inf_{\tau} \left\{ \left[\frac{F_{0k}(\tau)}{F_k(\tau)} \right] \wedge \left[\frac{1 - F_{0k}(\tau)}{1 - F_k(\tau)} \right] \right\} \leq (1 - p_k)$$

Bounds for (α_0, α_1) do *not* require z to be a valid instrument!

Upper Bounds for Mis-Classification Rates

Returns to Schooling Example: Oreopoulos (2006)

Sufficient Conditions To Identify α_0, α_1 , and β

Baseline Assumptions

- ▶ $\mathbb{E}[\varepsilon|z] = 0$
- ▶ $\mathbb{E}[\varepsilon|T^*, T, z] = \mathbb{E}[\varepsilon|T^*, z]$
- ▶ $\alpha_0 = \mathbb{P}(T = 1|T^* = 0, z)$, $\alpha_1 = \mathbb{P}(T = 0|T^* = 1, z)$, $\alpha_0 + \alpha_1 < 1$

Strengthen IV Assumption

- ▶ $\mathbb{E}[\varepsilon^2|z] = \mathbb{E}[\varepsilon^2]$
- ▶ $\mathbb{E}[\varepsilon^3|z] = \mathbb{E}[\varepsilon^3]$

Strengthen Measurement Error Assumption

- ▶ $\mathbb{E}[\varepsilon^2|T^*, T, z] = \mathbb{E}[\varepsilon^2|T^*, z]$
- ▶ $\mathbb{E}[\varepsilon^3|T^*, T, z] = \mathbb{E}[\varepsilon^3|T^*, z]$

First Moment Condition

Assumptions

- ▶ $\mathbb{E}[\varepsilon|z] = 0$
- ▶ $\mathbb{E}[\varepsilon|T^*, T, z] = \mathbb{E}[\varepsilon|T^*, z]$
- ▶ $\alpha_0 = \mathbb{P}(T = 1|T^* = 0, z)$
- ▶ $\alpha_1 = \mathbb{P}(T = 0|T^* = 1, z)$

Moment Condition

$$\text{Cov}(y, z) - \left(\frac{\beta}{1 - \alpha_0 - \alpha_1} \right) \text{Cov}(T, z) = 0$$

MC # 1 identifies $\beta/(1 - \alpha_0 - \alpha_1)$

Second Moment Condition

Additional Assumptions

- ▶ $\mathbb{E}[\varepsilon^2|z] = \mathbb{E}[\varepsilon^2]$
- ▶ $\mathbb{E}[\varepsilon^2|T^*, T, z] = \mathbb{E}[\varepsilon|T^*, z]$

Moment Condition

$$\text{Cov}(y^2, z) - \frac{\beta}{1 - \alpha_0 - \alpha_1} \left\{ 2\text{Cov}(yT, z) - \beta\text{Cov}(T, z) \left(\frac{1 + \alpha_0 - \alpha_1}{1 - \alpha_0 - \alpha_1} \right) \right\} = 0$$

Given MC #1, MC #2 identifies $(\alpha_1 - \alpha_0)$

Third Moment Condition

Additional Assumptions

- ▶ $\mathbb{E}[\varepsilon^3|z] = \mathbb{E}[\varepsilon^2]$
- ▶ $\mathbb{E}[\varepsilon^3|T^*, T, z] = \mathbb{E}[\varepsilon|T^*, z]$

Moment Condition

$$\text{Cov}(y^3, z) - \left(\frac{\beta}{1 - \alpha_0 - \alpha_1} \right) \left\{ \beta^2 \left[1 + \frac{6\alpha_0(1 - \alpha_1)}{(1 - \alpha_0 - \alpha_1)^2} \right] \text{Cov}(T, z) \right. \\ \left. - 3\beta \left[\frac{1 - (\alpha_1 - \alpha_0)}{1 - \alpha_0 - \alpha_1} \right] \text{Cov}(yT, z) + 3\text{Cov}(y^2 T, z) \right\} = 0$$

Sketch of Identification Argument

Very tedious algebra. . .

1. Use 1st MC to eliminate $\beta/(1 - \alpha_0 - \alpha_1)$ from others
2. Use 2nd MC to solve for α_1 in terms of α_0
3. 3rd MC becomes a quadratic in $(1 - \alpha_1)$ and observables only.
4. The quadratic always has two real roots: $(1 - \alpha_1)$ and α_0 .
5. To tell which root is which, use $\alpha_0 + \alpha_1 < 1$.
6. Calculate $\alpha_0 + \alpha_1$ and substitute into 1st MC to obtain β .

Unfortunately, identification of α_0, α_1 fails if $\beta = 0$. . .

Simple Special Case: $\alpha_0 = 0$

$$\text{Cov}(y, z) - \left(\frac{\beta}{1 - \alpha_0} \right) \text{Cov}(T, z) = 0$$

$$\text{Cov}(y^2, z) - \frac{\beta}{1 - \alpha_0} \{2\text{Cov}(yT, z) - \beta\text{Cov}(T, z)\} = 0$$

$$\beta = \frac{2\text{Cov}(yT, z)}{\text{Cov}(T, z)} - \frac{\text{Cov}(y^2, z)}{\text{Cov}(y, z)}$$

Simulation Example: $y = \beta T^* + \varepsilon$

Errors

$(\varepsilon, \eta) \sim$ jointly normal, mean 0, variance 1, correlation 0.5.

First-Stage

- ▶ Half of subjects have $z = 1$, the rest have $z = 0$.
- ▶ $T^* = \mathbf{1}\{\gamma_0 + \gamma_1 z + \eta > 0\}$
- ▶ $\delta = \mathbb{P}(T^* = 0|z = 1) = \mathbb{P}(T^* = 1|z = 0)$

Mis-classification

- ▶ Set $\alpha_0 = 0$ so $T^* = 0 \implies T = 0$
- ▶ $T|T^* = 1 \sim \text{Bernoulli}(1 - \alpha_1)$

$\beta = 3, \alpha_1 = 0.1, \delta = 0.15, n = 1000$

Bias = -0.002 , SD = 0.11

Bias = 0 , SD = 0.028

$\beta = 2, \alpha_1 = 0.1, \delta = 0.15, n = 1000$

Bias = -0.002 , SD = 0.118

Bias = 0.001 , SD = 0.042

Bias = -0.003 , SD = 0.216

Bias = 0.001 , SD = 0.274

$$\beta = 0.6, \alpha_1 = 0.1, \delta = 0.15, n = 1000$$

Bias = -0.004 , SD = 0.246

Bias = 0.002 , SD = 0.384

$\beta = 0.5, \alpha_1 = 0.1, \delta = 0.15, n = 1000$

Bias = 0.002 , SD = 0.297

Bias = -0.012 , SD = 0.616

$\beta = 0.4, \alpha_1 = 0.1, \delta = 0.15, n = 1000$

Bias = -0.009 , SD = 0.379

Bias = 0.017 , SD = 1.258

$\beta = 0.3, \alpha_1 = 0.1, \delta = 0.15, n = 1000$

Bias = 0.037 , SD = 5.375

Bias = 135.031 , SD = 13347.882

$(z \perp \varepsilon)$ and $(T \perp \varepsilon | T^*, z) \Rightarrow$ Continuum of MCs

Characteristic Functions

$$e^{i\omega\beta} [(1 - \alpha_1) - \xi(\omega)] = \alpha_0 - \xi(\omega)$$

$$\xi(\omega) \equiv \frac{\varphi_k(\omega) - \varphi_\ell(\omega)}{p_k \varphi_{1k}(\omega) - p_\ell \varphi_{1\ell}(\omega)}$$

Distribution Functions

$$\tilde{\Delta}_1(\tau + \beta) - \tilde{\Delta}_1(\tau) = \alpha_0 \Delta(\tau + \beta) - (1 - \alpha_1) \Delta(\tau)$$

$$\Delta(\tau) = F_k(\tau) - F_\ell(\tau)$$

$$\tilde{\Delta}_1(\tau) = p_k F_{1k}(\tau) - p_\ell F_{1\ell}(\tau)$$

CDF Conditions for Simulation DGP

$$\tilde{\Delta}_1(\tau + \beta) - \tilde{\Delta}_1(\tau) = \alpha_0 \Delta(\tau + \beta) - (1 - \alpha_1) \Delta(\tau)$$

Conclusion

Summary

- ▶ Endogenous, mis-measured binary treatment.
- ▶ Important in applied work but no solution in the literature.
- ▶ Usual (1st moment) IV assumption fails to identify β
- ▶ Bounds for mis-classification probabilities and β .
- ▶ Higher moment / independence restrictions identify β

Extensions / Work in Progress

- ▶ Efficient estimation w/ continuum of MCs
- ▶ Inference / Specification Testing
- ▶ LATE interpretation

Mahajan (2006, ECTA)

Regression Model

$$y = \mathbb{E}[y|T^*] + \nu$$

$$\mathbb{E}[\nu|T^*] = 0 \text{ by construction}$$

Causal Model

$$y = c + \beta T^* + \varepsilon$$

$$\mathbb{E}[\varepsilon|T^*] \neq 0$$

Main Result (Correct) – Exogenous Treatment

Relevant binary instrument z ($p_k^* \neq p_\ell^*$) identifies α_0, α_1 and $\mathbb{E}[y|T^*]$ provided that $\mathbb{E}[\nu|T^*, T, z] = 0$ and $\alpha_0 + \alpha_1 < 1$.

Extension (Incorrect) – Endogenous Treatment

$$\mathbb{E}[\varepsilon|z] = 0, p_k^* \neq p_\ell^*, \mathbb{E}[\varepsilon|T, T^*, z] = \mathbb{E}[\varepsilon|T^*] \implies \beta \text{ identified.}$$

Mahajan (2006, ECTA)

Regression Model

$$y = \mathbb{E}[y | T^*] + \nu$$

$$\mathbb{E}[\nu | T^*] = 0 \text{ by construction}$$

Causal Model

$$y = c + \beta T^* + \varepsilon$$

$$\mathbb{E}[\varepsilon | T^*] \neq 0$$

Ingredients

1. If $p_k^* \neq p_\ell^*$, $\mathbb{E}[\varepsilon | z] = 0$ then, since $\beta_{IV} = \beta / (1 - \alpha_0 - \alpha_1)$, knowledge of α_0, α_1 is sufficient to recover β . (Correct)
2. If $p_k^* \neq p_\ell^*$, $\mathbb{E}[\nu | T^*, T, z] = 0$, α_0, α_1 are identified. (Correct)

How to satisfy both 1 and 2 while allowing $\mathbb{E}[\varepsilon | T^*] \neq 0$?

3. Assume that $\mathbb{E}[\varepsilon | T^*, T, z] = \mathbb{E}[\varepsilon | T^*]$
(i.e. $m_{0k}^* = m_{0\ell}^*$ and $m_{1k}^* = m_{1\ell}^*$)

Flaw in the Argument

Proposition

If $\mathbb{E}[\varepsilon | T^*] \neq 0$ then $\mathbb{E}[\varepsilon | T^*, T, z] = \mathbb{E}[\varepsilon | T^*]$ combined with $\mathbb{E}[\varepsilon | z] = 0$ implies $p_k^* = p_\ell^*$, i.e. z is irrelevant for T^* .

Proof

$\mathbb{E}[\varepsilon | z] = 0$ implies

$$(1 - p_1^*)m_{0k}^* + p_1^*m_{1k}^* = c$$

$$(1 - p_2^*)m_{0\ell}^* + p_2^*m_{1\ell}^* = c$$

while Mahajan's assumption implies $m_{0k}^* = m_{0\ell}^*$ and $m_{1k}^* = m_{1\ell}^*$.

Therefore either $m_{0k}^* = m_{0\ell}^* = m_{1k}^* = m_{1\ell}^* = c$, which is ruled out by $E[\varepsilon | T^*] = 0$, or $p_k^* = p_\ell^*$.
