

Estimating the Effect of a Mis-measured, Endogenous, Binary Treatment

Francis J. DiTraglia
Camilo Garcia-Jimeno

University of Pennsylvania

November 19th, 2015

What is the causal effect of T^* ?

$$y_i = h(T_i^*, \mathbf{x}_i) + \varepsilon_i$$

- ▶ y – Outcome of interest
- ▶ h – Unknown function that *does not depend on* i
- ▶ T^* – Unobserved, endogenous binary treatment
- ▶ T – Observed, mis-measured surrogate for T^*
- ▶ \mathbf{x} – Exogenous covariates
- ▶ ε – Mean-zero error term
- ▶ z – Discrete instrumental variable

Example 1: Smoking and Birthweight (SNAP Trial)

Coleman et al. (N Engl J Med, 2012)

RCT with 1050 pregnant smokers in England: 521 given nicotine patches, the rest given placebo patches.

- ▶ y – Birthweight
- ▶ T^* – True smoking behavior
- ▶ T – Self-reported smoking behavior
- ▶ \mathbf{x} – Mother characteristics
- ▶ z – Indicator of nicotine patch

Example 2: Schooling and Test Scores

Burde & Linden (2013, AEJ Applied)

RCT in Afghanistan: 32 villages divided into 11 clusters. Randomly choose 6 and build a school in each village of these clusters.

- ▶ y – Score on math and language test
- ▶ T^* – True school attendance
- ▶ T – Self-reported school attendance
- ▶ \mathbf{x} – Household characteristics
- ▶ z – School built in village

Example 3: Job Training Partnership Act (JPTA)

Heckman et al. (2000, QJE)

Randomized offer of job training, but about 30% of those *not* offered also obtain training and about 40% of those offered training don't attend. Estimate causal effect of *training* rather than *offer* of training.

- ▶ y – Log wage
- ▶ T^* – True training attendance
- ▶ T – Self-reported training attendance
- ▶ \mathbf{x} – Individual characteristics
- ▶ z – Offer of job training

Non-classical Measurement Error: Binary T^*

- ▶ Many applications of linear model have *binary* treatment
- ▶ Binary $T^* \implies \mathbb{E}[T^* w] \leq 0$
- ▶ Misclassification Probabilities:

$$\alpha_0 = \mathbb{P}(T = 1 | T^* = 0)$$

$$\alpha_1 = \mathbb{P}(T = 0 | T^* = 1)$$

- ▶ Non-Differential Measurement Error: $T \perp (z, u) | T^*$
- ▶ $\sigma_{T^*}^2 \not\leq \sigma_T^2$ so work with α_0, α_1 rather than κ
- ▶ *Four-dimensional* Problem. . .

Results for a Mis-classified Binary Regressor

Aigner (1973), Bollinger (1996)...

- ▶ Even if $\rho_{T^*u} = 0$, OLS is biased and inconsistent: typically attenuated towards zero *but could flip signs!*

Kane et al. (1999), Black et al. (2000), Frazis et al. (2003)...

- ▶ $\rho_{zu} = 0 \implies$ IV solves endogenous regressor problem if there is no mis-classification
- ▶ $\rho_{T^*u} = 0$ and $\rho_{zu} = 0 \implies$ non-linear GMM estimator can solve the mis-classification problem

OLS and IV Probability Limits: Binary T^*

$$\text{plim} \left(\hat{\beta}_{OLS} \right) = \frac{\sigma_{T^*}^2}{\sigma_T^2} \left[\beta (1 - \alpha_0 - \alpha_1) + \frac{\sigma_{T^*u}}{\sigma_{T^*}^2} \right]$$

$$\text{plim} \left(\hat{\beta}_{IV} \right) = \frac{\beta}{1 - \alpha_0 - \alpha_1} + \frac{\sigma_{zu}}{\sigma_{zT}}$$

$$\sigma_{T^*}^2 = \frac{(p - \alpha_0)(1 - p - \alpha_1)}{(1 - \alpha_0 - \alpha_1)^2}$$

Where $p = \mathbb{P}(T = 1)$

What About Endogenous, Mis-measured T^* , Valid z ?

$$y = \beta T^* + u$$

$$u = c + \varepsilon$$

- ▶ No results in the literature for this case
- ▶ Important setting in applied work: e.g. RCTs
- ▶ Discrete Instrument: $z \in \{z_1, \dots, z_K\}$
- ▶ Non-parametric First Stage: $p_k^* = \mathbb{P}(T^* = 1 | z = z_k)$
- ▶ What does $E[\varepsilon | z] = 0$ buy us in this case?

Observable Moments: $y = \beta T^* + u$

	$z = 1$	$z = 1$	\dots	$z = K$
$T = 0$	\bar{y}_{01} p_{01}	\bar{y}_{02} p_{02}	\dots	\bar{y}_{0K} p_{0K}
$T = 1$	\bar{y}_{11} p_{11}	\bar{y}_{12} p_{12}	\dots	\bar{y}_{1K} p_{1K}

$$\bar{y}_{tk} = \mathbb{E}[y | T = t, z = z_k], \quad p_{tk} = q_k p_k$$

$$q_k = \mathbb{P}(z = z_k), \quad p_k = \mathbb{P}(T = 1 | z = z_k)$$

Unobservable Moments: $y = \beta T^* + u$

	$z = 1$	$z = 1$	\dots	$z = K$
$T^* = 0$	m_{01}^* p_{01}^*	m_{02}^* p_{02}^*	\dots	m_{0K}^* p_{0K}^*
$T^* = 1$	m_{11}^* p_{11}^*	m_{12}^* p_{12}^*	\dots	m_{1K}^* p_{1K}^*

$$m_{tk}^* = \mathbb{E}[u | T^* = t, z = z_k], \quad p_{tk}^* = q_k p_k^*$$

$$p_k^* = \mathbb{P}(T^* = 1 | z = z_k) = \frac{p_k - \alpha_0}{1 - \alpha_0 - \alpha_1}$$

Possible Assumptions On m_{tk}^*

Joint Exogeneity: $\mathbb{E}[\varepsilon | T^*, z] = 0$

$$\implies m_{tk}^* = c \quad \text{for all } t, k$$

Exogenous Treatment: $\mathbb{E}[\varepsilon | T^*] = 0$

$$\implies \frac{1}{\mathbb{P}(T^* = t)} \sum_k p_{tk}^* m_{tk}^* = c \quad \text{for all } t$$

Exogenous Instrument: $\mathbb{E}[\varepsilon | z] = 0$

$$\implies (1 - p_k^*) m_{0k}^* + p_k^* m_{1k}^* = c \quad \text{for all } k$$

Mahajan (2006, Econometrica)

Regression Model

$$y = \mathbb{E}[y|T^*] + \nu$$

$$\mathbb{E}[\nu|T^*] = 0 \text{ by construction}$$

Causal Model

$$y = c + \beta T^* + \varepsilon$$

$$\mathbb{E}[\varepsilon|T^*] \neq 0$$

Main Result (Correct) – Exogenous Treatment

Relevant binary instrument z ($p_1^* \neq p_2^*$) identifies α_0, α_1 and $\mathbb{E}[y|T^*]$ provided that $\mathbb{E}[\nu|T^*, T, z] = 0$.

Mahajan (2006, Econometrica)

Regression Model

$$y = \mathbb{E}[y|T^*] + \nu$$

$$\mathbb{E}[\nu|T^*] = 0 \text{ by construction}$$

Causal Model

$$y = c + \beta T^* + \varepsilon$$

$$\mathbb{E}[\varepsilon|T^*] \neq 0$$

Additional Result (Incorrect) – Endogenous Treatment

$$\mathbb{E}[\varepsilon|z] = 0, p_1^* \neq p_2^*, \mathbb{E}[\varepsilon|T, T^*, z] = \mathbb{E}[\varepsilon|T^*] \implies \beta \text{ identified.}$$

Mahajan's Argument

Regression Model

$$y = \mathbb{E}[y | T^*] + \nu$$

$$\mathbb{E}[\nu | T^*] = 0 \text{ by construction}$$

Causal Model

$$y = c + \beta T^* + \varepsilon$$

$$\mathbb{E}[\varepsilon | T^*] \neq 0$$

Ingredients

1. If $p_1^* \neq p_2^*$, $\mathbb{E}[\varepsilon | z] = 0$ then, since $\beta_{IV} = \beta / (1 - \alpha_0 - \alpha_1)$, knowledge of α_0, α_1 is sufficient to recover β . (Correct)
2. If $p_1^* \neq p_2^*$, $\mathbb{E}[\nu | T^*, T, z] = 0$, α_0, α_1 are identified. (Correct)

How to satisfy both 1 and 2 while allowing $\mathbb{E}[\varepsilon | T^*] \neq 0$?

3. Assume that $\mathbb{E}[\varepsilon | T^*, T, z] = \mathbb{E}[\varepsilon | T^*]$
(i.e. $m_{01}^* = m_{02}^*$ and $m_{11}^* = m_{12}^*$)

Mahajan's Argument

Proposition

If $\mathbb{E}[\varepsilon | T^*] \neq 0$ then $\mathbb{E}[\varepsilon | T^*, T, z] = \mathbb{E}[\varepsilon | T^*]$ combined with $\mathbb{E}[\varepsilon | z] = 0$ implies $p_1^* = p_2^*$, i.e. z is irrelevant for T^* .

Proof

Recall that $\mathbb{E}[\varepsilon | z] = 0$ implies

$$(1 - p_1^*)m_{01}^* + p_1^*m_{11}^* = c$$

$$(1 - p_2^*)m_{02}^* + p_2^*m_{12}^* = c$$

while Mahajan's assumption implies $m_{01}^* = m_{02}^*$ and $m_{11}^* = m_{12}^*$.

Therefore either $m_{01}^* = m_{02}^* = m_{11}^* = m_{12}^* = c$, which is ruled out by $E[\varepsilon | T^*] = 0$, or $p_1^* = p_2^*$.

What about increasing the support of z ?

$\mathbb{E}[\varepsilon|z] = 0 \implies$ *pair of equations for each $k = 1, \dots, K$*

$$\hat{y}_{0k} = \alpha_1(p_k - \alpha_0) \left(\frac{\beta}{1 - \alpha_0 - \alpha_1} \right) + (1 - \alpha_0)c - (p_k - \alpha_0)m_{1k}^*$$

$$\hat{y}_{1k} = (1 - \alpha_1)(p_k - \alpha_0) \left(\frac{\beta}{1 - \alpha_0 - \alpha_1} \right) + \alpha_0 c + (p_k - \alpha_0)m_{1k}^*$$

where $\hat{y}_{0k} = (1 - p_k)\bar{y}_{0k}$ and $\hat{y}_{1k} = p_k\bar{y}_{1k}$

2K Equations in $K + 4$ Unknowns

Theorem: β is unidentified regardless of K .

(For general case, see paper.)

Proof of special case: $\alpha_0 = 0$

1. System of equations simplifies to

$$\hat{y}_{0k} = c + p_k \beta \left(\frac{\alpha_1}{1 - \alpha_1} \right) - p_k m_{1k}^*$$

$$\hat{y}_{1k} = p_k \beta + p_k m_{1k}^*$$

2. $\beta/(1 - \alpha_1) \equiv \mathcal{W}$ is identified and imposing this, algebra gives $\beta\alpha_1/(1 - \alpha_1) = \mathcal{W} - \beta$.

Theorem: β is unidentified regardless of K .

(For general case, see paper.)

Proof of special case: $\alpha_0 = 0$ continued...

3. Substituting:

$$(c + p_k \mathcal{W} - \hat{y}_{0k})/p_k = \beta + m_{1k}^*$$

$$\hat{y}_{1k}/p_k = \beta + m_{1k}^*$$

4. Linear system in (β, m_{1k}^*) – no solution or ∞ of solutions.

5. Sum original pair of equations $\implies c + p_k \mathcal{W} - \hat{y}_{0k} = \hat{y}_{1k}$
thus ∞ of solutions. The model is unidentified.

Conditional *Second* Moment Independence.

New Assumption

Homoskedastic errors w.r.t. the *instrument*: $E[\varepsilon^2|z] = E[\varepsilon^2]$

Not Crazy!

Holds in an RCT or a *true* natural experiment.

New Moment Conditions

Defining $\mu_{k\ell}^* = (p_k - \alpha_0)m_{1k}^* - (p_\ell - \alpha_0)m_{k\ell}^*$,

$$\mathbb{E}(y^2|z_k) - \mathbb{E}(y^2|z_\ell) \equiv \Delta \overline{y^2} = \beta \mathcal{W}(p_k - p_\ell) + 2\mathcal{W}\mu_{k\ell}^*$$

$$\mathbb{E}(yT|z_k) - \mathbb{E}(yT|z_\ell) \equiv \Delta \overline{yT} = (1 - \alpha_1)\mathcal{W}(p_k - p_\ell) + \mu_{k\ell}^*$$

Theorem: $(\alpha_1 - \alpha_0)$ is Identified.

(Requires only binary z)

Proof

$$\Delta \overline{y^2} = \beta \mathcal{W}(p_k - p_\ell) + 2\mathcal{W}\mu_{k\ell}^*$$

$$\Delta \overline{yT} = (1 - \alpha_1)\mathcal{W}(p_k - p_\ell) + \mu_{k\ell}^*$$

Solve for $\mu_{k\ell}^*$, substitute and rearrange:

$$\mathcal{R} \equiv \beta - 2(1 - \alpha_1)\mathcal{W} = \frac{\Delta \overline{y^2} - 2\mathcal{W}\Delta \overline{yT}}{\mathcal{W}(p_k - p_\ell)}.$$

Rearrange and substitute $\beta = \mathcal{W}(1 - \alpha_0 - \alpha_1)$ to find

$$\alpha_1 - \alpha_0 = 1 + \mathcal{R}/\mathcal{W}.$$

What Good is $(\alpha_1 - \alpha_0)$?

- ▶ Test a necessary condition for *no mis-classification*: $\alpha_0 = \alpha_1$
- ▶ Simple, tighter partial identification bounds for β
- ▶ In some settings, one of the mis-classification probabilities is known to be zero $\implies \beta$ point identified

Conditional *Third* Moment Independence

New Assumption

Third moment independence w.r.t instrument: $E[\varepsilon^3|z] = E[\varepsilon^3]$

New Moment Conditions

Define $\lambda_{k\ell}^* = (p_k - \alpha_0)v_{1k}^* - (p_\ell - \alpha_0)v_{1\ell}^*$

where $v_{tk}^* = \mathbb{E}(u^2 | T^* = t, z_k)$. Then

$$\mathbb{E}(y^3|z_k) - \mathbb{E}(y^3|z_\ell) \equiv$$

$$\Delta \overline{y^3} = \beta^2 \mathcal{W}(p_k - p_\ell) + 3\beta \mathcal{W}\mu_{k\ell}^* + 3\mathcal{W}\lambda_{k\ell}^*$$

$$\mathbb{E}(y^2 T|z_k) - \mathbb{E}(y^2 T|z_\ell) \equiv$$

$$\Delta \overline{y^2 T} = \beta(1 - \alpha_1) \mathcal{W}(p_k - p_\ell) + 2(1 - \alpha_1) \mathcal{W}\mu_{k\ell}^* + \lambda_{k\ell}^*$$

Theorem: β , α_0 and α_1 are identified.

Requires $\alpha_0 + \alpha_1 < 1$, but z need only be binary.

Proof

$$\Delta \overline{y^3} = \beta^2 \mathcal{W}(p_k - p_\ell) + 3\beta \mathcal{W} \mu_{k\ell}^* + 3\mathcal{W} \lambda_{k\ell}^*$$

$$\Delta \overline{y^2 T} = \beta(1 - \alpha_1) \mathcal{W}(p_k - p_\ell) + 2(1 - \alpha_1) \mathcal{W} \mu_{k\ell}^* + \lambda_{k\ell}^*$$

Solve for $\lambda_{k\ell}^*$, substitute and rearrange:

$$\mathcal{S} \equiv \beta^2 - 3\mathcal{W}(1 - \alpha_1)(\beta + \mathcal{R}) = \frac{\Delta \overline{y^3} - 3\mathcal{W} [\Delta \overline{y^2 T} + \mathcal{R} \Delta \overline{y T}]}{\mathcal{W}(p_k - p_\ell)}.$$

Theorem: β , α_0 and α_1 are identified.

Requires $\alpha_0 + \alpha_1 < 1$, but z need only be binary.

Proof continued...

$$\mathcal{S} \equiv \beta^2 - 3\mathcal{W}(1 - \alpha_1)(\beta + \mathcal{R}) = \frac{\Delta \bar{y}^3 - 3\mathcal{W} [\Delta \bar{y}^2 \bar{T} + \mathcal{R} \Delta \bar{y} \bar{T}]}{\mathcal{W}(p_k - p_\ell)}$$

Use the fact that $\mathcal{R} = \beta - 2(1 - \alpha_1)\mathcal{W}$ to eliminate β from \mathcal{S} :

$$2\mathcal{W}^2(1 - \alpha_1)^2 + 2\mathcal{R}\mathcal{W}(1 - \alpha_1) + (\mathcal{S} - \mathcal{R}^2) = 0$$

which is a quadratic in $(1 - \alpha_1)$ and observables only! Can show that there are always two real roots: one is $(1 - \alpha_1)$ and the other is α_0 . To tell which is which, need $\alpha_0 + \alpha_1 < 1$.

Recap of Results

1. Using first-moment information alone, β is unidentified regardless of how many values the instrument takes on.
2. Using second moment information $\alpha_1 - \alpha_0$ is identified
 - ▶ Partial identification bound for β
 - ▶ Identifies β if α_0 is known (e.g. smoking/birthweight example)
3. Using third moment information β , α_0 and α_1 are identified so long as $\alpha_0 + \alpha_1 < 1$.

Simulation Study

$$y = \beta T^* + \varepsilon$$

$$T^* = \mathbf{1}\{\gamma_0 + \gamma_1 z + \eta > 0\}$$

$$\gamma_0 = \Phi^{-1}(\delta), \gamma_1 = \Phi^{-1}(1 - \delta) - \Phi(\delta) \text{ so that } \delta$$

E.g. if $\delta = 0.1$ then 10% of those *not* offered treatment get it anyway, and 10% of those offered treatment don't take it up.

If $T^* = 0$ then $T = 0$ (E.g. Birthweight and smoking)

$$T|T^* = 1 \sim \text{Bernoulli}(?)$$

$$\begin{bmatrix} \varepsilon \\ \eta \end{bmatrix} \sim N\left(\begin{bmatrix} 0 \\ 0 \end{bmatrix}, \begin{bmatrix} 1 & 0.3 \\ 0.3 & 1 \end{bmatrix}\right)$$

Sampling Distribution of $\hat{\alpha}_1 - \hat{\alpha}_0$

(a) $N = 500, \delta = 0.1$

(b) $N = 1000, \delta = 0.1$

(c) $N = 5000, \delta = 0.1$

(a) $N = 500, \delta = 0.3$

(b) $N = 1000, \delta = 0.3$

(c) $N = 5000, \delta = 0.3$

Sampling Distribution of $\hat{\beta} = (1 - \hat{\alpha}_0 - \hat{\alpha}_1)\hat{\beta}_{IV}$

(a) $N = 500, \delta = 0.1$

(b) $N = 1000, \delta = 0.1$

(c) $N = 5000, \delta = 0.1$

(a) $N = 500, \delta = 0.3$

(b) $N = 1000, \delta = 0.3$

(c) $N = 5000, \delta = 0.3$

Empirical Illustration: Schooling and Test Scores
