# Mis-Classified, Binary, Endogenous Regressors: Identification and Inference

Francis J. DiTraglia
Camilo García-Jimeno

University of Pennsylvania

January 18th, 2018

## What is the effect of $T^*$ ?

$$y = c(\mathbf{x}) + \beta(\mathbf{x})T^* + \varepsilon$$

- ▶ y − Outcome of interest
- ▶ T\* Unobserved, endogenous binary regressor
- ➤ T Observed, mis-measured binary surrogate for T\*
- x Exogenous covariates
- ► z Discrete (typically binary) instrumental variable

(Additively Separable  $\varepsilon$  and binary  $T^* \Rightarrow$  linear model given  $\mathbf{x}$ )

# Using a discrete IV to learn about $\beta(\mathbf{x})$

$$y = c(\mathbf{x}) + \beta(\mathbf{x})T^* + \varepsilon$$

### Constributions of This Paper

- Show that only existing point identification result for mis-classified, endogenous T\* is incorrect.
- 2. Derive sharp identified set for  $\beta(\mathbf{x})$  under standard assumptions.
- 3. Prove point identification of  $\beta(\mathbf{x})$  under slightly stronger assumptions.
- 4. Point out problem of weak identification in mis-classification models, develop identification-robust inference for  $\beta(\mathbf{x})$ .

# Example: Smoking and Birthweight (SNAP Trial)

Coleman et al. (N Engl J Med, 2012)

RCT with pregnant smokers in England: half given nicotine patches, the rest given placebo patches. Some given nicotine fail to quit; some given placebo quit.

- ▶ y Birthweight
- ▶ T\* True smoking behavior
- ► T Self-reported smoking behavior
- x Mother characteristics
- z Indicator of nicotine patch

## Binary, Endogenous Regressor

## Mahajan (2006),

Shiu (2015), Denteh et al. (2016), Ura (2016), Calvi et al. (2017)

# "Baseline" Assumptions I – Model & Instrument

## Additively Separable Model

$$y = c(\mathbf{x}) + \beta(\mathbf{x})T^* + \varepsilon, \quad \mathbb{E}[\varepsilon] = 0$$

Valid & Relevant Instrument:  $z \in \{0, 1\}$ 

- $ightharpoonup \mathbb{P}(T^* = 1 | \mathbf{x}, z = 1) \neq \mathbb{P}(T^* = 1 | \mathbf{x}, z = 0)$
- $\qquad \mathbb{E}[\varepsilon|\mathbf{x},z] = 0$
- ▶  $0 < \mathbb{P}(z = 1 | \mathbf{x}) < 1$

If  $T^*$  were observed, these conditions would identify  $\beta$ .

# "Baseline" Assumptions II – Measurement Error

#### Notation: Mis-classification Rates

"\tau" 
$$\alpha_0(\mathbf{x}, z) \equiv \mathbb{P}(T = 1 | T^* = 0, \mathbf{x}, z)$$

"
$$\downarrow$$
"  $\alpha_1(\mathbf{x}, z) \equiv \mathbb{P}(T = 0 | T^* = 1, \mathbf{x}, z)$ 

## Mis-classification unaffected by z

$$\alpha_0(\mathbf{x}, z) = \alpha_0(\mathbf{x}), \quad \alpha_1(\mathbf{x}, z) = \alpha_1(\mathbf{x})$$

#### Extent of Mis-classification

$$\alpha_0(\mathbf{x}) + \alpha_1(\mathbf{x}) < 1$$
 ( $T$  is positively correlated with  $T^*$ )

#### Non-differential Mis-classification

$$\mathbb{E}[\varepsilon|\mathbf{x}, z, T^*, T] = \mathbb{E}[\varepsilon|\mathbf{x}, z, T^*]$$

# Existing Result for Endogenous $T^*$ is Incorrect

## Mahajan (2006; Ecta) A.2

 $\mathbb{E}[\varepsilon|\mathbf{x},z,T^*,T] = \mathbb{E}[\varepsilon|\mathbf{x},T^*]$ , plus "Baseline"  $\Rightarrow \beta(\mathbf{x})$  point identified when  $T^*$  is endogenous.

#### This is incorrect...

We prove that, under Mahajan's assumptions, the instrument must be uncorrelated with  $T^*$  unless  $T^*$  is in fact exogenous.

# Simple Bounds for Mis-classification from First-stage

Unobserved Observed 
$$ho_k^*(\mathbf{x}) \equiv \mathbb{P}(T^*=1|\mathbf{x},z=k)$$
  $p_k(\mathbf{x}) \equiv \mathbb{P}(T=1|\mathbf{x},z=k)$ 

## Relationship

$$\rho_k^*(\mathbf{x}) = \frac{\rho_k(\mathbf{x}) - \alpha_0(\mathbf{x})}{1 - \alpha_0(\mathbf{x}) - \alpha_1(\mathbf{x})}, \quad k = 0, 1$$

z does not affect  $(\alpha_0, \alpha_1)$ ; denominator  $\neq 0$ 

#### Bounds for Mis-classification

$$\alpha_0(\mathbf{x}) \le p_k(\mathbf{x}) \le 1 - \alpha_1(\mathbf{x}), \quad k = 0, 1$$

$$\alpha_0(\mathbf{x}) + \alpha_1(\mathbf{x}) < 1$$

 $\alpha_0 \leq \min_k \{p_k\}, \quad \alpha_1 \leq \min_k \{1 - p_k\}$ 

## What does IV estimate under mis-classification?

#### Unobserved

$$\beta(\mathbf{x}) = \frac{\mathbb{E}[y|\mathbf{x}, z = 1] - \mathbb{E}[y|\mathbf{x}, z = 0]}{\rho_1^*(\mathbf{x}) - \rho_0^*(\mathbf{x})}$$

## Wald (Observed)

$$\frac{\mathbb{E}[y|\mathbf{x},z=1] - \mathbb{E}[y|\mathbf{x},z=0]}{p_1(\mathbf{x}) - p_0(\mathbf{x})} = \beta(\mathbf{x}) \left[ \frac{p_1^*(\mathbf{x}) - p_0^*(\mathbf{x})}{p_1(\mathbf{x}) - p_0(\mathbf{x})} \right] = \frac{\beta(\mathbf{x})}{1 - \alpha_0(\mathbf{x}) - \alpha_1(\mathbf{x})}$$

$$| p_1^*(\mathbf{x}) - p_0^*(\mathbf{x}) = \frac{p_1(\mathbf{x}) - \alpha_0(\mathbf{x})}{1 - \alpha_0 - \alpha_1(\mathbf{x})} - \frac{p_0(\mathbf{x}) - \alpha_0(\mathbf{x})}{1 - \alpha_0 - \alpha_1(\mathbf{x})} = \frac{p_1(\mathbf{x}) - p_0(\mathbf{x})}{1 - \alpha_0(\mathbf{x}) - \alpha_1(\mathbf{x})}$$

# Partial Identification Bounds for $\beta(\mathbf{x})$

#### Known Result

- $\triangleright \beta(\mathbf{x})$  is between Wald and Reduced form; same sign as Wald.
- Doesn't rely on non-differential assumption or additive sep.
- ► Frazis & Loewenstein (2003), Ura (2016), . . .

### Non-differential Assumption

- $\qquad \mathbb{E}[\varepsilon|\mathbf{x},T^*,T,z] = \mathbb{E}[\varepsilon|\mathbf{x},T^*,z]$
- ▶ Used in literature to identify  $\beta(\mathbf{x})$  when  $T^*$  is exogenous.
- ▶ Does it restrict the identified set when *T*\* is endogenous?

(Suppress x for simplicity)

#### **Notation**

- $ightharpoonup r_{tk} \equiv \mathbb{P}(T^* = 1 | T = t, z = k)$ , function of  $(\alpha_0, \alpha_1)$  and observables only
- $ightharpoonup z_k$  is shorthand for z = k

## Iterated Expectations over $T^*$

$$\mathbb{E}(y|T=0,z_k) = (1-r_{0k})\mathbb{E}(y|T^*=0,T=0,z_k) + r_{0k}\mathbb{E}(y|T^*=1,T=0,z_k)$$

$$\mathbb{E}(y|T=1,z_k) = (1-r_{1k})\mathbb{E}(y|T^*=0,T=1,z_k) + r_{1k}\mathbb{E}(y|T^*=1,T=1,z_k)$$

(Suppress x for simplicity)

#### **Notation**

- $ightharpoonup r_{tk} \equiv \mathbb{P}(T^* = 1 | T = t, z = k)$ , function of  $(\alpha_0, \alpha_1)$  and observables only
- $\triangleright$   $z_k$  is shorthand for z = k

### Adding Non-differential Assumption

$$\mathbb{E}(y|T = 0, z_k) = (1 - r_{0k})\mathbb{E}(y|T^* = 0, z_k) + r_{0k}\mathbb{E}(y|T^* = 1, z_k)$$

$$\mathbb{E}(y|T = 1, z_k) = (1 - r_{1k})\mathbb{E}(y|T^* = 0, z_k) + r_{1k}\mathbb{E}(y|T^* = 1, z_k)$$

2 equations in 2 unknowns  $\Rightarrow$  solve for  $\mathbb{E}(y|T^*=t^*,z=k)$  given  $(\alpha_0,\alpha_1)$ .

## Law of Total Probability

$$F_{tk} = (1 - r_{tk})F_{tk}^0 + r_{tk}F_{tk}^1$$

$$F_{tk} \equiv \text{Observed CDF: } y | (T = t, z = k)$$
 $F_{tk}^{t^*} \equiv \text{Unobserved CDF: } y | (T^* = t^*, T = t, z = k)$ 

#### Previous Slide

- $ightharpoonup r_{tk}$  observable given  $(\alpha_0, \alpha_1)$
- $ightharpoonup \mathbb{E}(y|T^*,T,z) = \mathbb{E}(y|T^*,z)$  observable given  $(\alpha_0,\alpha_1)$

## **Key Question**

Given  $(\alpha_0, \alpha_1)$  can we always find  $(F_{tk}^0, F_{tk}^1)$  to satisfy the mixture model?

## **Equivalent Problem**

Given a specified CDF F, for what values of p and  $\mu$  do there exist valid CDFs (G, H) with F = (1 - p)G + pH and  $\mu = \text{mean}(H)$ ?

#### Valid CDFS

$$0 \le H \le 1$$
  
 $0 \le G \le 1 \iff [F - (1-p)]/p \le H \le F/p$ 

$$\max\left\{0,\,\frac{F(x)}{p}-\frac{1-p}{p}\right\}\leq H(x)\leq \min\left\{1,\frac{F(x)}{p}\right\}$$

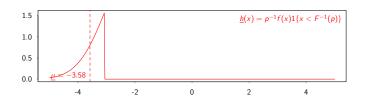

#### **Notation**

$$\overline{H} \equiv \max \left\{ 0, \, \frac{F(x)}{p} - \frac{1-p}{p} \right\}, \quad \underline{H} \equiv \min \left\{ 1, \frac{F(x)}{p} \right\}$$

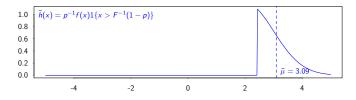

#### 1<sup>st</sup> Order Stochastic Dominance

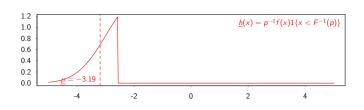

$$H(x) \le H(x) \le \underline{H}(x) \quad \text{for all } x$$

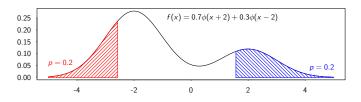

$$\implies \underbrace{\int_{\mathbb{R}} x \, \underline{H}(dx)}_{\underline{\mu}(p,F)} \le \underbrace{\int_{\mathbb{R}} x \, H(dx)}_{\underline{\mu}(p,F)} \le \underbrace{\int_{\mathbb{R}} x \, \overline{H}(dx)}_{\underline{\mu}(p,F)}$$

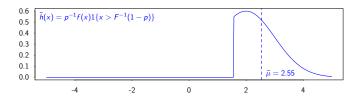

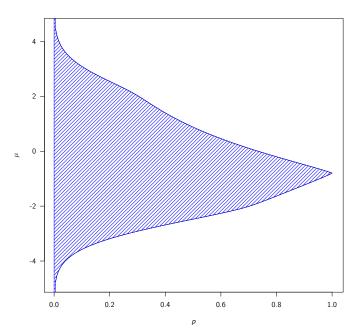

## Necessary and Sufficient Condition if F is Continuous

$$\int_{-\infty}^{F^{-1}(p)} \frac{x}{p} f(x) dx \le \mu \le \int_{F^{-1}(1-p)}^{+\infty} \frac{x}{p} f(x) dx$$

## Back to Our Original Problem

- ▶ Observe  $F_{tk}$  for all (t, k)
- $ightharpoonup r_{tk}$  pinned down by  $(\alpha_0, \alpha_1)$
- ► Can we find  $F_{tk}^{t^*}$  so that  $F_{tk} = (1 r_{tk})F_{tk}^0 + r_{tk}F_{tk}^1$ ?
- ▶ Non-diff. assumption  $\Rightarrow$  mean of  $F_{tk}^1$  pinned down by  $(\alpha_0, \alpha_1)$ .
- ▶ Implies joint restrictions on  $(\alpha_0, \alpha_1)$ , hence  $\beta$ .

# Sharp Identified Set under Baseline Assumptions

#### **Theorem**

Under baseline assumptions, sharp identified set for  $\beta(\mathbf{x})$  is never a singleton, regardless of how many (discrete) values z takes on.

#### Intuition

No mis-classification  $\Rightarrow r_{tk} = 0$  or 1 and we can always form a valid mixture in this case. Show that Wald estimand always lies within the sharp identified set for  $\beta$ .

# Point Identification: 1st Ingredient

### Reparameterization

$$\begin{aligned} \theta_1(\mathbf{x}) &= \beta(\mathbf{x}) / \left[ 1 - \alpha_0(\mathbf{x}) - \alpha_1(\mathbf{x}) \right] \\ \theta_2(\mathbf{x}) &= \left[ \theta_1(\mathbf{x}) \right]^2 \left[ 1 + \alpha_0(\mathbf{x}) - \alpha_1(\mathbf{x}) \right] \\ \theta_3(\mathbf{x}) &= \left[ \theta_1(\mathbf{x}) \right]^3 \left[ \left\{ 1 - \alpha_0(\mathbf{x}) - \alpha_1(\mathbf{x}) \right\}^2 + 6\alpha_0(\mathbf{x}) \left\{ 1 - \alpha_1(\mathbf{x}) \right\} \right] \\ & \left[ \beta(\mathbf{x}) = 0 \iff \theta_1(\mathbf{x}) = \theta_2(\mathbf{x}) = \theta_3(\mathbf{x}) = 0 \right] \end{aligned}$$

#### Lemma

Baseline Assumptions  $\implies Cov(y, z|\mathbf{x}) = \theta_1(\mathbf{x})Cov(z, T|\mathbf{x}).$ 

# Point Identification: 2nd Ingredient

## Assumption (II)

$$\mathbb{E}[\varepsilon^2|\mathbf{x},z] = \mathbb{E}[\varepsilon^2|\mathbf{x}]$$

#### Lemma

(Baseline) + (II) 
$$\Longrightarrow$$
  $Cov(y^2, z|\mathbf{x}) = 2Cov(yT, z|\mathbf{x})\theta_1(\mathbf{x}) - Cov(T, z|\mathbf{x})\theta_2(\mathbf{x})$ 

## Corollary

(Baseline) + (II) +  $[\beta(\mathbf{x}) \neq 0] \implies [\alpha_1(\mathbf{x}) - \alpha_0(\mathbf{x})]$  is identified.

Hence,  $\beta(\mathbf{x})$  is identified if mis-classification is one-sided.

# Point Identification: 3rd Ingredient

## Assumption (III)

- (i)  $\mathbb{E}[\varepsilon^2|\mathbf{x}, z, T^*, T] = \mathbb{E}[\varepsilon^2|\mathbf{x}, z, T^*]$
- (ii)  $\mathbb{E}[\varepsilon^3|\mathbf{x},z] = \mathbb{E}[\varepsilon^3|\mathbf{x}]$

#### Lemma

$$(Baseline) + (II) + (III) \implies$$

$$Cov(y^3, z|\mathbf{x}) = 3Cov(y^2T, z|\mathbf{x})\theta_1(\mathbf{x}) - 3Cov(yT, z|\mathbf{x})\theta_2(\mathbf{x}) + Cov(T, z|\mathbf{x})\theta_3(\mathbf{x})$$

### Point Identification Result

#### **Theorem**

(Baseline) + (II) + (III)  $\implies \beta(\mathbf{x})$  is point identified. If  $\beta(\mathbf{x}) \neq 0$ , then  $\alpha_0(\mathbf{x})$  and  $\alpha_1(\mathbf{x})$  are likewise point identified.

#### **Proof Sketch**

- 1.  $\beta(\mathbf{x}) = 0 \iff \theta_1(\mathbf{x}) = 0$  so suppose this is not the case.
- 2. Lemmas: full-rank linear system in  $\theta_1(\mathbf{x}), \theta_2(\mathbf{x}), \theta_3(\mathbf{x})$  & observables.
- 3. Non-linear eqs. relating  $\theta_1(\mathbf{x}), \theta_2(\mathbf{x}), \theta_3(\mathbf{x})$  to  $\beta(\mathbf{x})$  and  $\alpha_0(\mathbf{x}), \alpha_1(\mathbf{x})$ . Show that solution exists and is unique.

## Sufficient Conditions for (II) and (III)

- (i) T is conditionally independent of  $(\varepsilon, z)$  given  $(T^*, \mathbf{x})$
- (ii) z is conditionally independent of  $\varepsilon$  given x

# Just-Identified System of Moment Equalities

Suppress dependence on  $\mathbf{x}$  to simplify the notation from here on. . .

#### Collect Lemmas from Above:

$$\begin{aligned} \mathsf{Cov}(y,z) - \mathsf{Cov}(T,z)\theta_1 &= 0 \\ \mathsf{Cov}(y^2,z) - 2\mathsf{Cov}(yT,z)\theta_1 + \mathsf{Cov}(T,z)\theta_2 &= 0 \\ \mathsf{Cov}(y^3,z) - 3\mathsf{Cov}(y^2T,z)\theta_1 + 3\mathsf{Cov}(yT,z)\theta_2 - \mathsf{Cov}(T,z)\theta_3 &= 0 \end{aligned}$$

#### Notation: Observed Data Vector

$$\mathbf{w}'_{i} = (T_{i}, y_{i}, y_{i}T_{i}, y_{i}^{2}, y_{i}^{2}T_{i}, y_{i}^{3})$$

# Just-Identified System of Moment Equalities

$$oxed{\mathbb{E}\left[\left(oldsymbol{\Psi}'(oldsymbol{ heta})oldsymbol{\mathsf{w}}_i-oldsymbol{\kappa}
ight)\otimes\left(egin{array}{c}1\z_i\end{array}
ight)
ight]=oldsymbol{0}}$$

#### Weak Identification Problem

Moment are conditions uninformative about  $(\alpha_0, \alpha_1)$  when  $\beta$  is small: GMM performs very badly.  $\bullet$  sims

# Inference for a Mis-classified Regressor

#### The Problem

- ▶  $\beta$  small  $\Rightarrow$  moment equalities uninformative about  $(\alpha_0, \alpha_1)$   $\bigcirc$  more
- $(\alpha_0, \alpha_1)$  could be on the boundary of the parameter space
- ▶ Also true of existing estimators that assume *T*\* exogenous

#### Our Solution

- ▶ Sharp identified set result from above remains informative even if  $\beta$  is small or zero.
- ▶ Implies a number of *inequality* moment conditions
- Identification-robust inference combining equality and inequality moment conditions based on generalized moment selection (GMS)

# Moment Inequalities I – First-stage Probabilities

$$\alpha_0 \le p_k \le 1 - \alpha_1$$
 becomes  $\mathbb{E}\left[m_{1k}^l(\mathbf{w}_i, \boldsymbol{\vartheta})\right] \ge \mathbf{0}$  for all  $k$  where

$$m_{1k}^{I}(\mathbf{w}_{i}, \boldsymbol{\vartheta}) \equiv \begin{bmatrix} \mathbf{1}(z_{i} = k)(T - \alpha_{0}) \\ \mathbf{1}(z_{i} = k)(1 - T_{i} - \alpha_{1}) \end{bmatrix}$$

# Moment Inequalities II – Non-differential Assumption

For all k, we have  $\mathbb{E}[m_{2k}^{l}(\mathbf{w}_{i}, \vartheta, \mathbf{q}_{k})] \geq 0$  where

$$m_{2k}^{I}\left(\mathbf{w}_{i},\boldsymbol{\vartheta},\mathbf{q}_{k}\right) \equiv \begin{bmatrix} y_{i}\mathbf{1}\left(z_{i}=k\right)\left\{\left(T_{i}-\alpha_{0}\right)-\mathbf{1}\left(y_{i}\leq\underline{q}_{0k}\right)\left(1-T_{i}\right)\left(\frac{1-\alpha_{0}-\alpha_{1}}{\alpha_{1}}\right)\right\}\\ -y_{i}\mathbf{1}\left(z_{i}=k\right)\left\{\left(T_{i}-\alpha_{0}\right)-\mathbf{1}\left(y_{i}>\overline{q}_{0k}\right)\left(1-T_{i}\right)\left(\frac{1-\alpha_{0}-\alpha_{1}}{\alpha_{1}}\right)\right\}\\ y_{i}\mathbf{1}\left(z_{i}=k\right)\left\{\left(T_{i}-\alpha_{0}\right)-\mathbf{1}\left(y_{i}\leq\underline{q}_{1k}\right)T_{i}\left(\frac{1-\alpha_{0}-\alpha_{1}}{1-\alpha_{1}}\right)\right\}\\ -y_{i}\mathbf{1}\left(z_{i}=k\right)\left\{\left(T_{i}-\alpha_{0}\right)-\mathbf{1}\left(y_{i}>\overline{q}_{1k}\right)T_{i}\left(\frac{1-\alpha_{0}-\alpha_{1}}{1-\alpha_{1}}\right)\right\} \end{bmatrix}$$

and  $\mathbf{q}_k \equiv (\underline{q}_{0k}, \overline{q}_{0k}, \underline{q}_{1k}, \overline{q}_{1k})'$  defined by  $\mathbb{E}[h_k^I(\mathbf{w}_i, \vartheta, \mathbf{q}_k)] = 0$  with

$$h_k^I(\mathbf{w}_i, \boldsymbol{\vartheta}, \mathbf{q}_k) = \begin{bmatrix} \mathbf{1}(y_i \leq \underline{q}_{0k}) \mathbf{1}(z_i = k) (1 - T_i) - \left(\frac{\alpha_1}{1 - \alpha_0 - \alpha_1}\right) \mathbf{1}(z_i = k) (T_i - \alpha_0) \\ \mathbf{1}(y_i \leq \overline{q}_{0k}) \mathbf{1}(z_i = k) (1 - T_i) - \left(\frac{1 - \alpha_0}{1 - \alpha_0 - \alpha_1}\right) \mathbf{1}(z_i = k) (1 - T_i - \alpha_1) \\ \mathbf{1}(y_i \leq \underline{q}_{1k}) \mathbf{1}(z_i = k) T_i - \left(\frac{1 - \alpha_1}{1 - \alpha_0 - \alpha_1}\right) \mathbf{1}(z_i = k) (T_i - \alpha_0) \\ \mathbf{1}(y_i \leq \overline{q}_{1k}) \mathbf{1}(z_i = k) T_i - \left(\frac{\alpha_0}{1 - \alpha_0 - \alpha_1}\right) \mathbf{1}(z_i = k) (1 - T_i - \alpha_1) \end{bmatrix}$$

# Inference With Moment Equalities and Inequalities

#### Moment Conditions

$$\mathbb{E}\left[m_j(\mathbf{w}_i,\vartheta_0)\right] \geq 0, \quad j = 1,\cdots, J$$

$$\mathbb{E}\left[m_j(\mathbf{w}_i,\vartheta_0)\right] = 0, \quad j = J+1,\cdots, J+K$$

#### Test Statistic

$$T_{n}(\vartheta) = \sum_{j=1}^{J} \left[ \frac{\sqrt{n} \ \bar{m}_{n,j}(\vartheta)}{\widehat{\sigma}_{n,j}(\vartheta)} \right]_{-}^{2} + \sum_{j=J+1}^{J+K} \left[ \frac{\sqrt{n} \ \bar{m}_{n,j}(\vartheta)}{\widehat{\sigma}_{n,j}(\vartheta)} \right]^{2}$$

#### Critical Value

- $\sqrt{n}\, ar{m}_n(\vartheta_0) o_d$  normal limit with covariance matrix  $\Sigma(\vartheta_0)$
- ▶ Use this to bootstrap the limit dist. of  $T_n(\vartheta)$  under  $H_0: \vartheta = \vartheta_0$

# Generalized Moment Selection: Andrews & Soares (2010)

## Moment Selection Step

If 
$$\frac{\sqrt{n}\,\bar{m}_{n,j}(\vartheta_0)}{\widehat{\sigma}_{n,j}(\vartheta_0)} > \sqrt{\log n}$$
, ignore ineq.  $j$  when calculating critical value.

#### Theoretical Guarantees

Uniformly valid test of  $H_0$ :  $\vartheta = \vartheta_0$  regardless of whether  $\vartheta_0$  is identified.

Not asymptotically conservative.

#### Drawback

Joint test for the whole parameter vector but we're only interested in  $\beta$ 

## Bonferroni-Based Inference Procedure

## Leverage Special Structure of Model

- $\beta$  only enters MCs through  $\theta_1 = \beta/(1 \alpha_0 \alpha_1)$
- ▶ Inference for  $\theta_1$  is standard if z is a strong IV.
- $(\kappa, \mathbf{q})$  strongly identified under null for  $(\alpha_0, \alpha_1)$

#### Procedure

- 1. Concentrate out  $(\theta_1, \kappa, q) \implies$  joint GMS test for  $(\alpha_0, \alpha_1)$
- 2. Invert  $\implies$   $(1 \delta_1) \times 100\%$  confidence set for  $(\alpha_0, \alpha_1)$
- 3. Project  $\implies$  CI for  $(1 \alpha_0 \alpha_1)$
- 4. Construct standard  $(1 \delta_2) \times 100\%$  IV CI for  $\theta_1$
- 5. Bonferroni  $\implies$   $(1 \delta \delta_2) \times 100\%$  CI for  $\beta$

Simple example with a simulated dataset.

## Conclusion

- Identification and inference for effect of binary, mis-classified, endogenous regressor.
- 2. Show that only existing point identification result is incorrect.
- 3. Derive sharp identified set for  $\beta(\mathbf{x})$  under standard assumptions.
- 4. Prove point identification of  $\beta(\mathbf{x})$  under slightly stronger assumptions.
- 5. Point out problem of weak identification in mis-classification models, develop identification-robust inference for  $\beta(\mathbf{x})$ .

### Related Past and Current Research

Talk about how this paper fits into a research agenda concerning measurement error: the beliefs paper, this paper, returns to lying (with Arthur), and biased measurements of displacement in the paper with Camilo.

## Full Independence $\implies$ Continuum of Moment Equalities

### Suppose that

- (i) T is conditionally independent of  $(\varepsilon, z)$  given  $(T^*, \mathbf{x})$
- (ii) z is conditionally independent of  $\varepsilon$  given  ${\bf x}$

### Then for all $\tau$ we have

$$\widetilde{\Delta}_{1}(\tau + \beta) - \widetilde{\Delta}_{1}(\tau) = \alpha_{0}\Delta(\tau + \beta) - (1 - \alpha_{1})\Delta(\tau)$$

$$\Delta(\tau) = F_{k}(\tau) - F_{\ell}(\tau)$$

$$\widetilde{\Delta}_{1}(\tau) = p_{k}F_{1k}(\tau) - p_{\ell}F_{1\ell}(\tau)$$

But if  $\beta = 0$  this reduces to  $F_k(\tau) - F_\ell(\tau) = 0$ 

# Simulation DGP: $y = \beta T^* + \varepsilon$

Sample Size = 1000; Simulation Replications = 2000

#### **Errors**

 $(\varepsilon,\eta)\sim$  jointly normal, mean 0, variance 1, correlation 0.5.

## First-Stage

- ▶ Half of observations have z = 1, the rest have z = 0.
- $T^* = \mathbf{1} \{ \gamma_0 + \gamma_1 z + \eta > 0 \}$

#### Mis-classification

- ▶  $T|T^* = 0 \sim \text{Bernoulli}(\alpha_0)$
- $T \mid T^* = 1 \sim \text{Bernoulli}(1 \alpha_1)$
